✅ Improvements Made

1. Font Choice
Used the Verdana font to give a simple, clean, and professional appearance suitable for a resume. It improves readability on all screens.

2. Color Palette
I selected soft and readable colors like:

- lavender as the background for a calming effect

- lightblue in the top section for clarity

- white for content cards to create visual separation

- navy and darkblue for headings to maintain a professional tone

3. CSS Selectors
I used a combination of:

- **Element selectors** (body, h1, p, ul) for base styling

- **Class selectors** (like .navbar, .card, .list) for repeated styles

- **ID selectors** (#top-section, #main-container) for specific sections

4. Display & Positioning (Flexbox)
I created a responsive navigation bar using display: flex and justify-content: center. It helps align links in the center neatly, even on smaller screens.

5. Layout & Visual Appeal

- I added box-shadow and border-radius to cards for a soft UI

- Aligned and spaced all sections using padding and margin

- Used max-width to keep content centered and not stretch too wide

6. Footer
Simple centered footer text added to give a clean finish.

Conclusion:
This website reflects my personality as a student who is learning but also puts effort into presentation. I've used basic yet effective CSS to improve layout and user experience. All changes were made by myself using what I learned in class.
